

Lockscreen autorotation

Posted by hhuber2001 - 12 Apr 2013 20:40

Hi!

As we all know the lockscreen won't rotate automatically. To fix this just add

```
setprop lockscreen.rot_override true
```

to the end of /system/etc/init.d/90userinit

or you could add

```
lockscreen.rot_override=true
```

to /system/build.prop

Enjoy

@hhuber2001

Thanks for your tip.

Could you tell us which image your are using.

I've used Krook and Kaschemme CM10 image, and as far as I understand the problem, I've no issue with the screen rotation.

If I lock the auto-rotation with the switch, it locks, otherwise it rotates as expected.

Thanks

Yves

I had the problem with both images. If your tablet is turned off and you have to swipe or enter a pincode to unlock the device. The screen is always in the default landscape orientation (charging port on the bottom). With my little hack the lockscreen will always face the right direction.
